

# PIP Week 2 thesis

## SUT Top-100 Thesis Validation Report

### Current range number of sut token in crypto market

current market value evidence :

<https://coinmarketcap.com/currencies/supertrust/>

Currently market value number is #301

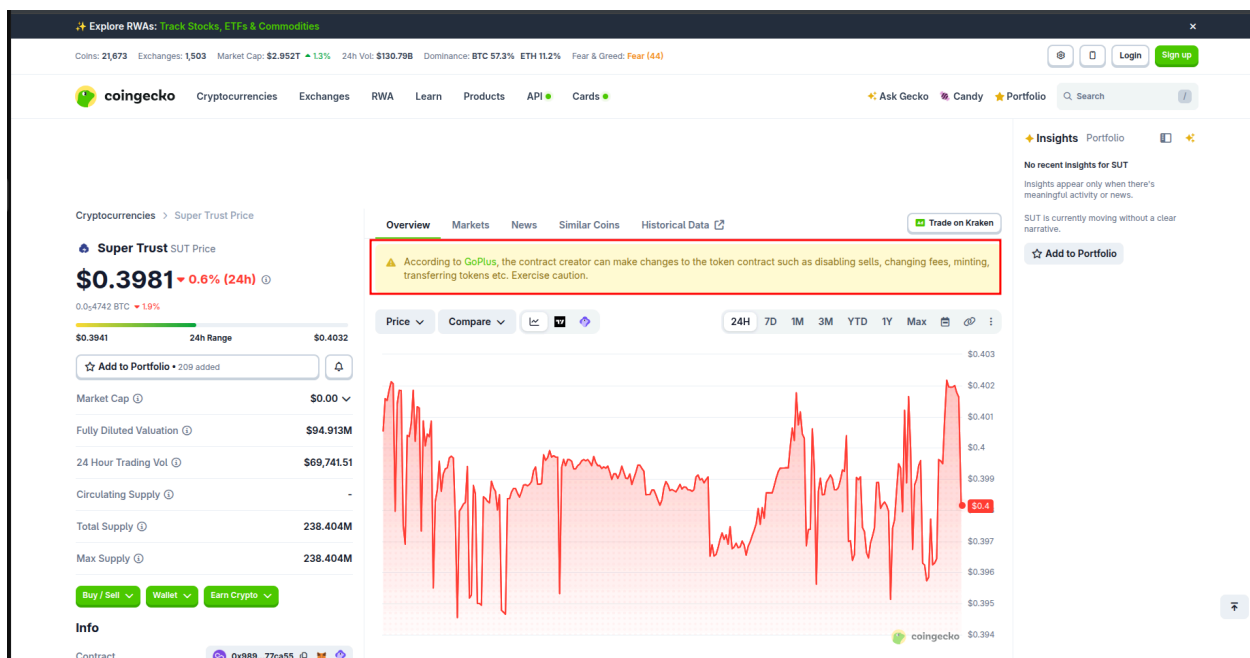

### Risks and Red flags:

- contract control: GoPlus (a token security scanner) warns that "the contract creator can make changes to the token contract such as disabling sells, changing fees, minting, transferring tokens etc." That means the issuer can technically change or freeze the token.
- Exchange loss: the BitMart delisting (Mar 2026) removed a trading venue without a stated reason.

- Dependence on one operator: SUT's usefulness depends on one group's platforms staying active and honouring the discounts.
- Usage is unproven: Most platforms have little activity, and the main benefit is a discount for Korean users only.

## Source evidence of contract control

## SUT vs TOP-100 COINS - COMPARISON AND POSSIBILITIES

Why SUT ranks around #300, why the top 100 are there, and what it would take

Prepared 30 Sep 2026 · QA Engineering, MUST Company

**Data:** live CoinMarketCap listing data, 30 Sep 2026. SUT details are from `docs/sut-coin-research-2026-09-29.txt`.

**Not financial advice. Crypto market data changes daily.**

## 1. THE GAP IN NUMBERS

|                                    | Top-100 band (#90-#110)        | SUT (#301)                   | Gap   |
|------------------------------------|--------------------------------|------------------------------|-------|
| Market cap to enter top 100        | \$413M (#100 coin)             | \$75M                        | ~5.5x |
| Price SUT would need               | ~\$2.19                        | \$0.398                      | ~5.5x |
| Daily trading volume (median)      | \$46M                          | ~\$0.08M                     | ~600x |
| Daily volume / market cap (median) | 12.4%                          | 0.11%                        | ~110x |
| Lowest daily volume in band        | \$4.1M (meme coin, #93)        | ~\$0.08M                     | ~50x  |
| Security audit / verified team     | common                         | none                         |       |
| Tier-1 exchange listings           | most (Binance, Coinbase, etc.) | Gate, KuCoin, BingX, Uniswap |       |

Even the weakest coin around #100 trades about 50 times more than SUT every day. The price gap (5.5x) is the smaller problem. The trading and trust gap is much larger.

## Coins ranked #90-#110 on 29 Sep 2026, for reference:

| Rank | Coin                                        | Market Cap | Volume   |
|------|---------------------------------------------|------------|----------|
| #90  | Artificial Superintelligence Alliance (FET) | \$530M     | \$199.0M |
| #91  | Raydium (RAY)                               | \$516M     | \$76.2M  |

| Rank | Coin                   | Market Cap | Volume   |
|------|------------------------|------------|----------|
| #92  | Midnight (NIGHT)       | \$516M     | \$39.7M  |
| #93  | 币安人生 (meme)            | \$510M     | \$4.1M   |
| #94  | TrueUSD (TUSD)         | \$494M     | \$17.1M  |
| #95  | EURC                   | \$459M     | \$66.3M  |
| #96  | Plasma (XPL)           | \$448M     | \$145.9M |
| #97  | Pieverse (PIEVERSE)    | \$429M     | \$142.6M |
| #98  | Celestia (TIA)         | \$423M     | \$52.6M  |
| #99  | Pendle (PENDLE)        | \$415M     | \$52.7M  |
| #100 | Bitcoin SV (BSV)       | \$413M     | \$15.2M  |
| #101 | SPX6900 (SPX)          | \$385M     | \$9.5M   |
| #102 | Lido DAO (LDO)         | \$385M     | \$82.4M  |
| #103 | Falcon Finance (FF)    | \$376M     | \$12.9M  |
| #104 | BitTorrent [New] (BTT) | \$372M     | \$14.0M  |
| #105 | Pons (PONS)            | \$361M     | \$46.9M  |
| #106 | Tezos (XTZ)            | \$353M     | \$7.6M   |
| #107 | Kite (KITE)            | \$351M     | \$23.6M  |
| #108 | Immutable (IMX)        | \$347M     | \$18.9M  |
| #109 | Monad (MON)            | \$340M     | \$72.0M  |
| #110 | The Graph (GRT)        | \$335M     | \$46.1M  |
| ...  | ...                    | ...        | ...      |
| #301 | SuperTrust (SUT)       | \$75M      | \$0.08M  |

## 2. WHY SUT SITS AROUND #300

### 1. The rank comes from an accounting change.

CoinMarketCap started counting 188.4M SUT as circulating (instead of 2.02M) on 10 Feb 2026. SUT went from #2,049 to #299 overnight at the same price. It was not growth.

## **2. Almost nobody trades it.**

About \$70K a day, mostly on one exchange (Gate). Its market cap is not backed by real buying and selling.

## **3. Trust problems.**

Reported fraud allegations, a bank freeze, a GOPAX delisting, three unexplained crashes, and ~71% of tokens in 10 wallets.

## **4. Usage is unproven.**

Most platforms have little activity, and the main benefit is a discount for Korean users only.

---

# **3. WHY THE TOP-100 COINS ARE THERE, BY TYPE**

## **Real-world assets done properly**

Examples: Tether Gold XAUt (#34), Ondo ONDO (#39), PAX Gold PAXG (#50), XDC Network (#74)

What earns their place: regulated issuers; assets that can be redeemed (PAX Gold is 1 token = 1 oz of gold held in custody); regular independent audits of reserves; institutional users.

## **Payments**

Examples: TRON TRX (#8), Stable (#76), Plasma XPL (#96), Pieverse (#97)

What earns their place: large real payment volume (mostly stablecoins); open to anyone; supported by many wallets and apps.

## **Stablecoins**

Examples: TrueUSD TUSD (#94), EURC (#95)

What earns their place: backed by cash with regular attestations; used everywhere as a trading and payment unit.

## Decentralised finance (DeFi)

Examples: Raydium RAY (#91), Pendle PENDLE (#99), Lido LDO (#102)

What earns their place: money locked in the protocol and fee revenue that can be seen on-chain; token holders take part in governance.

## Infrastructure

Examples: Celestia TIA (#98), Tezos XTZ (#106), Monad MON (#109), The Graph GRT (#110)

What earns their place: other projects build on them; developer ecosystems; well-known venture backers (a16z, Coinbase Ventures).

## Meme coins

Examples: 币安人生 (#93), SPX6900 (#101)

What earns their place: large communities and deep liquidity on major exchanges. No utility, but constant real trading.

# 4. WHAT THEY DO THAT SUT DOESN'T

| Success factor               | Typical top-100 coin                                   | SUT today                                                          |
|------------------------------|--------------------------------------------------------|--------------------------------------------------------------------|
| Deep, real trading           | \$5M-\$200M+ a day                                     | ~\$0.07M a day                                                     |
| Listed on big exchanges      | Binance, Coinbase, OKX                                 | Gate, KuCoin, BingX; delisted from GOPAX; no longer traded on MEXC |
| Independent security audit   | Yes, published                                         | None (CertiK: not audited)                                         |
| Known team, identity-checked | Public teams, often with venture backing               | No KYC; advisors can't be verified                                 |
| Clear regulatory standing    | Licensed issuers, especially for RWAs                  | Bank freeze and a reported criminal complaint                      |
| Usage you can verify         | Locked value, payment volume or active users, on-chain | Company claims only (2,000+ stores, 40K+ members)                  |

| Success factor            | Typical top-100 coin                           | SUT today                                           |
|---------------------------|------------------------------------------------|-----------------------------------------------------|
| Real asset backing (RWAs) | Audited reserves the token can be redeemed for | Gold and mine claims unverified                     |
| Open to anyone            | Anyone can build on it or use it               | Useful mainly on one operator's platforms, in Korea |
| Honest data               | One consistent supply figure                   | Three conflicting supply figures                    |
| Spread-out holdings       | Wide ownership                                 | Top 10 wallets hold ~71%                            |

## 5. POSSIBILITIES - CAN SUT REACH THE TOP 100?

**Mathematically:** yes. A price of about \$2.19 (with 188.4M circulating) would reach the ~\$413M threshold. SUT traded above that for most of 2025.

**Realistically:** not soon, and not the way it is framed. Two different routes lead there, and only one is sound.

### [NOT SOUND] Pushing the price or rank

- Using volume, buybacks or supply-figure changes.
- With markets this thin, the price can be pushed up cheaply, but it collapses when support stops. That is what the three past crashes look like.
- It is also market manipulation, which carries legal risk for the people involved.

### [SOUND] Earning it, the way RWA and payment peers did

1. Fix trust first: register with regulators, resolve the bank and legal issues, publish a wallet map and one supply figure, and lock the liquidity.
2. Prove it is safe: an independent smart-contract audit, a team KYC and a bug bounty.
3. Prove it is used: publish real SoloPay and platform payment volume and active users, ideally checkable on-chain.
4. If "RWA" is the story: back SUT with audited, redeemable assets and regular reserve reports, like PAX Gold and Tether Gold.

5. Only then apply for bigger exchanges. They check all of the above before listing.

Steps 1-4 realistically take many months, and the legal items are not in the company's control alone.

---

## CONCLUSION FOR THE VALIDATION REPORT

"Top 100 is reachable only if SUT closes the trust, liquidity and proof gaps. Today it meets few of the benchmarks the top 100 share."

---
